VipNordic and VipNordic App

VipNordic is a system that controls a network of seismographs that are constantly capturing vibrations and transmitting these data in real time. The system allows seismographs to be added; Create blasts; Capture of vibration data such as PPV, frequency and displacements.

The VipNordic System can be fully integrated with the O-Pitblast, thus providing powerful resources for the project manager.

Key Features:

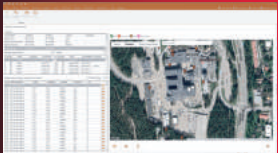

Map & Add measuring point

Had blast locations and measurements points and extract vibration readings in real time.

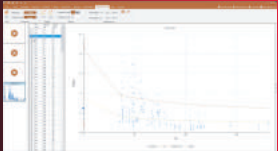

PPV and Vibration

Control and set PPV and vibrations limits on each measurement point and receive alerts if these limits are reached.

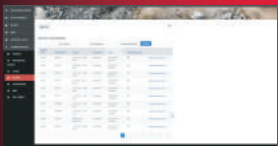

Smart Filters

Filter your projects by blasts, measurement points, vibrations limit and location.

Attenuation Law

Generate automatic attenuation laws to your operation by selecting measurement points, blast or locations.

Vibration alarms

Easily set vibration restrictions for each measurement point and receive alerts and warnings if these limits are achieved.

Vibration Histograms

Combine vibration waves with histogram information like maximum instantaneous charge (MIC) and number of boreholes blasting at a given interval.

With correct working methods and modern tools such as VipNordic service and O-Pitblast it is possible to control vibrations generated by Drilling and Blasting.

For more informations about VipNordic conditions, please contact our team: info@o-pitblast.com
